

Press Release

2009 June 24 - Blue Oceans' Crushes Costs for Customers

Techenomics International has recently launched on its website www.techenomics.net, Blue Oceans, the first fully integrated condition monitoring software package designed to increase equipment reliability and availability whilst crushing costs for customers.

Blue Oceans, formerly known as Client Analysis Access System, moulds the function of the equipment planner, maintenance service teams and reliability engineer into one powerful unit creating a true 'Blue Ocean' for customers to exploit and enhance their businesses while saving money.

Clients using Blue Oceans will be able to trend, create modules, and customise their data on all analysis results. Non-services customers are able to create and integrate data obtained from their existing oil analysis provider and other condition monitoring programmes into their own unique modules and formats for equipment trending.

"Techenomics philosophy of innovation and investment to provide the complete package in oil analysis products, condition monitoring and maintenance services is represented by the creation of Blue Oceans," explains Chris Adsett, CEO, Techenomics International.

"Over the next year we plan on adding modules to Blue Oceans that will focus on preventative maintenance and save our customers even more time and money." Mr Adsett continues. An exciting new logo for Blue Oceans has been created to compliment its uniqueness and link to Techenomics International.
